

fillwith 10202

Clea F. Rees

2024/08/08

Abstract

A small package originally based on [Harish Kumar's answer](#) to a question I asked on [TeX SE](#)¹. The intended purpose was the creation of worksheets for students where I would like L^AT_EX to use the available vertical space to provide lined areas for answers. Since then, the code has been (partially) rewritten in `expl3` and extended in response to both my own needs and others' questions on [TeX SE](#). The package aims to do one thing: to fill a vertical space in the same way as, say, `\vfill`, but with some kind of 'filler' rather than empty space. Currently, the package supports solid rules or dotted lines. The remainder of the current line may optionally be filled in the same way and the 'filler' may be coloured if desired.

Lines may optionally be numbered, though the numbered versions should not be used to fill long stretches as they are extremely inefficient. **Numbered fills are highly experimental and not recommended for use in 'real' documents.** That is, it seems to work, but I recommend using an alternative package or solution if you need a reliable numbering mechanism.

1 Load

To use the package simply load it in your preamble in the usual way.

```
\usepackage[<options>]{fillwith}
```

A small number of options may be specified when loading the package. See section 4.

We start with an example in section 2. Section 3 describes the basic commands illustrated in this example. Section 4 explains the options used by these commands, together with other customisation features of `fillwith`.

2 Example

The code below illustrates most package features.

Figure 1 demonstrates filling with rules. Note the effect of altering `fillwith ht` on line-spacing.

Figure 2 shows dotted fillings. Note the use of `\fillwithset` to alter the colour.

¹See tex.stackexchange.com/a/241139/.

3 Usage

`\fillwith [<options>]`

`\fillwith*` Fill vertically with current settings, optionally modified by *<options>*. See section 4 for *<options>*. If used in the middle of a line, the starred form fills to the end of the line first, whereas the unstarred form does not.

`\fillwithrules [<line-spacing>]`

`\fillwithrules*` Convenience wrappers which just set `style = rules` and set the line-spacing to *<line-spacing>*. These macros do nothing which cannot be done using `\fillwith` and `\fillwith*`.

`\fillwithdottedlines [<line-spacing>]`

`\fillwithdottedlines*` Convenience wrappers which just set `style = dots` and set the line-spacing to *<line-spacing>*. These macros do nothing which cannot be done using `\fillwith` and `\fillwith*`.

`\fillwithnolines [<options>]`

`\fillwithnolines*` Fill vertically with current settings, numbering each complete line, after optionally setting *<options>*. Numbering **requires** use of these commands, as opposed to the generic `\fillwith/\fillwith*`.

4 Customisation

Options can be set per use, locally or globally. A small number of options are implemented as package options (section 1).

`\fillwithset {⟨options⟩}` Set local or global defaults.

`colour (opt.) =⟨colour name⟩`

`color (opt.)` Colour to be used for (solid) rules.

`lliw (opt.)` Initially `gray`. Available as a package option.

`dottedcolor (opt.) =⟨colour name⟩`

`dottedcolour (opt.)` Colour to be used for dotted lines.

Initially `black`. Available as a package option.

`cont (opt.) =true|false`

Whether to fill the remainder of any current line. Generally, users will probably prefer to use the starred command forms for local usage, but this option permits modification of the package default on a local or global basis.

Initially `false`. Default is `true`.

`fillwith ht (opt.) =⟨real positive number expressed as decimal⟩`

Multiplication factor for line-spacing. Typically, hand-written content requires greater spacing than typewritten content. This option scales the standard line-spacing.

Initially 2, which is also the default value. Decimal values such as 1.5 are permitted.

`goal ht (opt.) =⟨dimension⟩`

Used only by `\fillwithnolines` and `\fillwithnolines*`. Sets the target dimension to fill with numbered lines. If unspecified, the code tries to fill the remaining vertical space on the current page. If more than one use of a `fillwith` macro is used on a single page, this option **must** be used for numbered fills to prevent a single instance taking (almost) all available space. In contrast, multiple unnumbered fills can coexist on the same page without issue — the available space will simply be divided equally between them.

Initially unset. No default.

`no font (opt.) =⟨font switches⟩`

Font switches to apply when typesetting numbers for numbered fills.

Initially `\normalfont\normalsize`, which is also the default value. Note the commands used here should be switches rather than text commands – for example, use `\bfseries` rather than `\textbf` — since the commands should not expect an argument.

`style (opt.) =rule|dots|line|lines|rules`

Style of fill. `rule`, `line`, `rules` and `lines` are synonyms which all denote solid rules or lines. `dots` uses dotted lines rather than solid rules. The dots are slightly more densely packed than the standard used for dotted fills by the standard classes, as these seem a bit too widely spaced to provide ideal guidelines.

Initially `dots`, which is also the default value.

If an unknown value is used, the code will attempt to use two macros derived from that value. The first is constructed simply by preceding `<value>` with a backslash and the second by also appending part. For example, if `style=⟨mystyle⟩` is used, the code will try to use `\mystyle` and `\mystylepart` for complete and partial lines. In theory, this supports filling with somewhat arbitrary content, but the implementation is untested and **should not be used in real documents**.

5 Implementation

You do not need to read the remainder of this document in order to install or use the package.
